

Hazard Analysis Critical Control Points (HACCP)

General Statement

Hazard Analysis and Critical Control Points (HACCP) is a systematic preventive approach to food safety from biological, chemical and physical hazards in production processes, that can cause the finished product to be unsafe, and designs measurements to reduce these risks to a safe level.

The HACCP system can be used at all stages of a food chain, from food production and preparation processes including, packaging, distribution etc. In this manner, HACCP is referred to as the prevention of hazards rather than finished product inspection.

Product Range

Fileder Filter Systems has reviewed their position in relation to HACCP and can confirm that their product range supplied does not fall directly within the scope, as their primary function is not food preparation*. However, Fileder Filter Systems does take hygiene and product integrity extremely seriously and, as a matter of importance, has set out the below guidelines for employees to adhere to.

Operating Guidelines

Operating guidelines implemented by Fileder Filter Systems include:

- A strict hygiene policy within the warehouse ensures that the risk of cross contamination is greatly reduced, no food or drink (except water) is to be consumed within the warehouse and despatch area to assist in this
- All filter products are stored, wrapped and boxed within our warehouse
- The warehouse is subjected to regular pest control inspections by a third party
- All products are shipped out of the warehouse fully packaged

Fileder Filter Systems believes that the steps put in place ensure that no contamination from biological, chemical or physical hazards can occur.

Any product modifications, such as private labelling, end capping and bespoke system builds are conducted in the Production Facility, who operate under the same strict controls as the warehouse and despatch area with additional quality checks conducted.
